

## 实验02 简单组合逻辑电路 2022/10/13

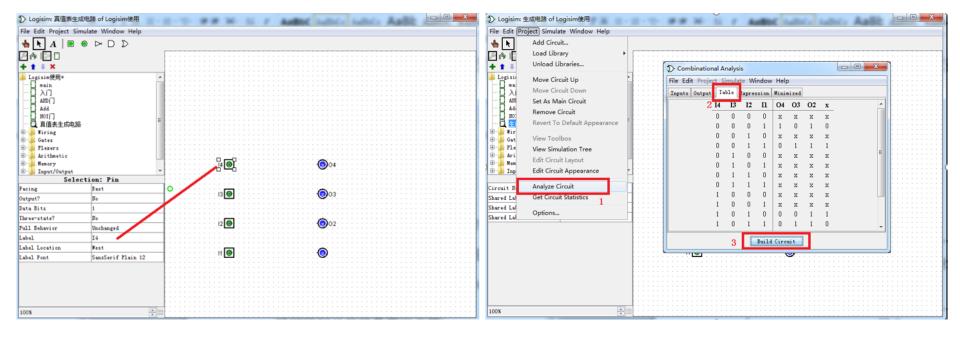

#### 实验原理

- 熟练掌握Logisim的基本用法
- ■进一步熟悉Logisim更多功能
- 用Logisim设计组合逻辑电路并进行仿真
- 初步学习Verilog语法

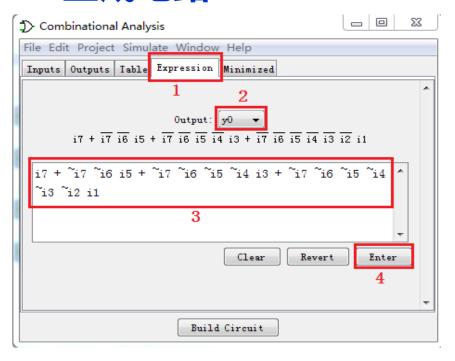

### 实验环境

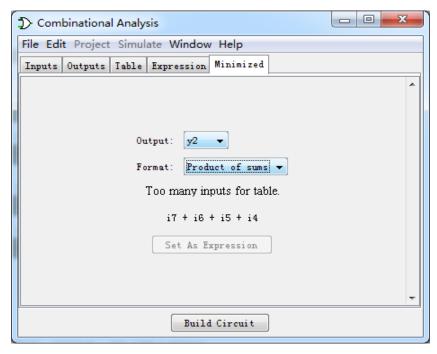

- vlab.ustc.edu.cn
- **Logisim**
- verilogoj.ustc.edu.cn

- Step1: 在Logisim中用真值表自动生成电路
  - ■在电路中放置输入输出引脚,并对其命名
  - ■编辑电路真值表: "Project" <del>→</del> "Analyze
    - Circuit" → "Table"
  - ■生成电路: "Build Circuit"

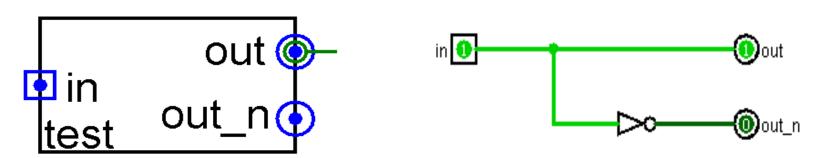

- Step2: 用表达式生成电路图
  - ■在电路中放置输入输出引脚,并对其命名
  - ■编辑电路真值表: "Project" → "Analyze
    - **Circuit**" → "Expression"
  - ■生成电路: "Build Circuit"

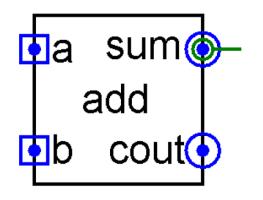

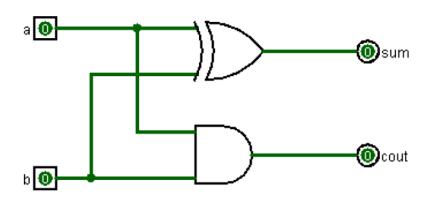

#### ■ Step3: Verilog语法入门\_模块结构

```
module test( //模块名称
input in, //输入信号声明
output out, //输出信号声明
output out_n);
//如需要,可在此处声明内部变量
/**********/
assign out = in;
assign out_n = ~in;
/********逻辑描述部分结束*****/
endmodule //模块名结束关键词
```

#### ■ Step3: Verilog语法入门\_功能电路设计

```
module add(
input a, b,
output sum, cout);
assign sum = a ^ b;
assign cout = a & b;
endmodule
```

```
module add(
input a, b,
output sum, cout);
assign {cout, sum} = a + b;
endmodule
```

#### ■ Step3: Verilog语法入门\_模块调用

```
sum
                              a sum
                                          a sum
<u></u> a
                               add
                                           add
                                         b cout carry2
                   b 🛈
     cout
<u>⊈</u>b
                              b cout
                                                           (O) cout
                  cin 🛈
tin full_add
                                               carry1
                             .a (s),
module full_add(
                             .b (cin),
input a, b, cin,
output sum, cout);
                             . sum (sum),
wire s, carry1, carry2;
                             .cout (carry2));
add add_inst1(
                             assign cout = carry1 / carry2;
.a (a),
                             endmodule
. b (b),
. sum (s ),
.cout (carry1));
add add inst2(
```

■ Step4:完成实验指导手册中的练习题

■ Step5: 按时提交检查并提交实验报告

■ Step6: 登录verilogoj.ustc.edu.cn进行编码练习

# 谢谢!
